Paper No(s)/Mail Date 2-9-04.

6) Other:

Application/Control Number: 10/773,439

Art Unit: 2834

The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negatived by the manner in which the invention was made.

Claims 1-4 and 10 are rejected under 35 U.S.C. 103(a) as being unpatentable over the prior art in view of Dam and combined with Goodson.

The prior art (applicants fig. 8 teaches all the claimed transducer structure except the connective element are not a flexible aluminum based arrangement. However, Dam (note figs. 3A and 3B0 teaches providing electrodes as flexible chains of stamped brass to produce solder connections which have assembly and durability advantages

Goodson (see col. 5, lines 19-50) teaches electrodes can be either brass or aluminum.

Since selection from among known suitable materials has long been held to be within the skill expected of the routineer, and Goodson demonstrates both brass and aluminum as alternatives, use of aluminum foil for the brass foil of Dam would have been obvious to one of ordinary skill in the art (e.g. based on cost, resistance to oxidization, conductivity etc.).

Claims 5-9 objected to as being dependent upon a rejected base claim, but would be allowable if rewritten in independent form including all of the limitations of the base claim and any intervening claims.

Further cited of interest are Lombard, Swanson and Kaneko.
